

README - NMS Bases Sorted Alphabetically

- 2026-05-21

This Python script sorts a “No Man’s Sky” base list alphabetically, which means the “My Bases” section, of a terminus, will be in alphabetical order. This is quite useful if you name your bases alphabetically.

I name my bases Gxxx-Basename, eg. ‘G209-FOOTHOLD-PORTAL’.

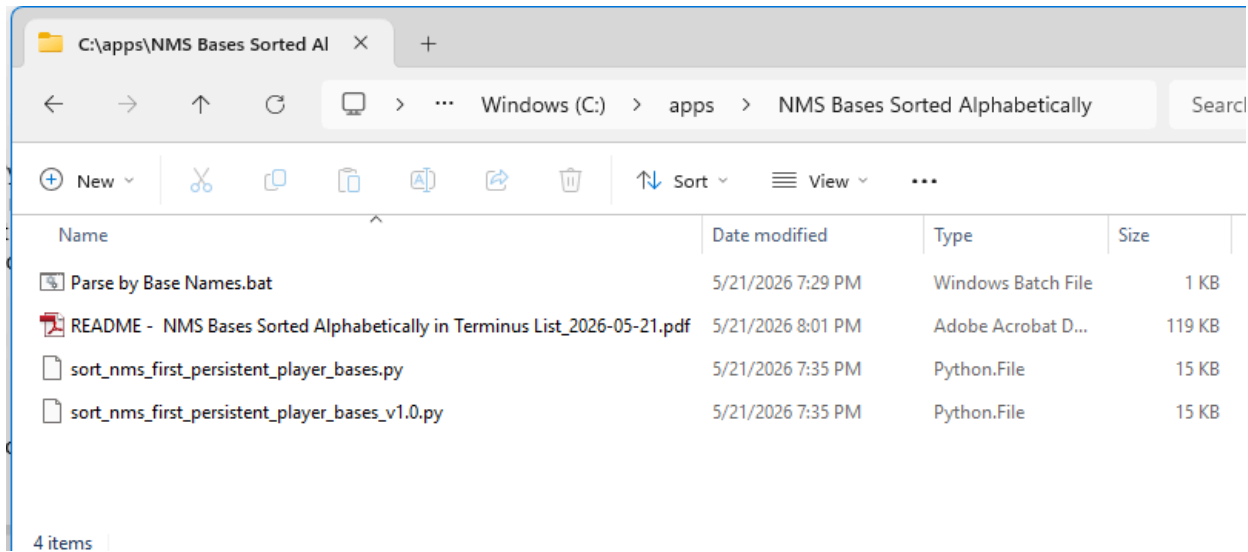

Using These Files to Sort Your Bases

Prerequisites

In Windows 11 you will need Python capability and PowerShell capability to run it. I suppose you could just use a good old Windows command line window if you’d rather, but I used PowerShell. This document is not a PowerShell nor Python tutorial, so follow your googles and AI’s and you’ll get there. All you have to do is enable these things and/or perform a small installation to get them up and running. You do not need to program anything! At worst you’ll need to right-click-open the .bat file to change the name of your JSON export’s zip file.

Steps

Extract the files to a folder in your Windows system. I suggest something like shown below, but it can be anywhere.

There will likely be two Python script files (.py) in the ZIP file you download, as shown above. They are identical. Two exist because the versioned file is there to let you know what version you are running, and the non-versioned is there so you will not need to rename the other file to this name, as this name is specifically called in the .bat file. You can adjust these values for your own reasons. I.e, if you change a script filename make sure to change its reference within the .bat file.

Export your gamesave JSON from your favorite gamesave editor. Vector or GoatFungus are both simple to use for that. Place the JSON file into the folder you designated above.

Back up your existing gamesave/s.

The included .bat file contains the following command line:

```
py sort_nms_first_persistent_player_bases.py save.hg.zip
```

py invokes Python, followed by the py scriptname, followed by the zip filename containing your JSON export from your gamesave file. You can optionally also call a non-zipped json file. The script supports both, although most of my testing to date has been using a zipped file.

You can change any of those values to something you like better, and/or you can simply type the command line that fits your reality in the terminal prompt or PowerShell prompt.

Assuming your filenames match the contents of the .bat file, double-click the .bat file to run it, and it will produce a newly sorted JSON for you.

Use your gamesave editor to import the JSON into your existing gamesave.

Check your terminus 'My Bases' section and see them listed alphabetically.
